RESEARCH INTERESTS

I am an engineer and environmental chemist that focuses on the development of environmental sensors and robotics and their application to water science. I study water with a focus on the interaction between chemistry and microbial life and how this interplay influences environmental nutrient flows and ecosystem productivity. I am particularly interested in how these interactions vary over time and space because understanding these patterns critically tests our understanding of how natural aquatic systems function. For this reason, most of my academic career has been focused on advancing the state of the art in environmental observation and studying challenging environmental mixing processes using advanced observing techniques. I use a variety of techniques including remotely operated and autonomous vehicles, sensor networks, and custom instrumentation. I am also interested in the development and application of ocean instrumentation and vehicles for (i) the enhanced study of Earth system processes and analogous

processes on water worlds; (ii) dynamic mixing of groundwater, freshwater, seawater, and geofluids; and (iii) chemical and energy exchange between the lithosphere and the ocean.
